

STRAWBERRY PRODUCTION

Natrasol is a highly refined liquid natural seaweed concentrate made from fresh kelp stems (Durvillaea potatorum) collected from the west coast of Tasmania, capturing the richest source of natural growth stimulants of any seaweed in the world.

The benefits of foliar feeding Natrasol is the increased uptake of nutrients from the soil to supply the plant with a number of natural growth regulators.

Foliar fertilization causes the plant to pump more sugars and other exudates from its roots into the narrow region of soil (rhizosphere) to influence root secretions and beneficial soil microorganisms.

In turn, this enhanced biological activity, increases the availability of nutrients, disease-suppressive bio-chemicals, vitamins, and other factors beneficial to the plant.

BENEFFITS

- ✓ Improve rooting and shoot growth of new plantings
- ✓ Increase leaf chlorophyll resulting in strong healthy growth.
- ✓ Improve flowering and fruit set
- ✓ Produce better quality and higher berry yield
- ✓ Increase plant's frost tolerance
- ✓ Reduced incidence of disease

Natrasol is a premium grade seaweed extract with a particle size of 100 microns.

For optimum plant uptake, spray Natrasol early in the morning or in the cool of the afternoon when most of the nutrients and growth regulators will be in the sap stream within the first hour of foliar application.

APPLICATION

Foliar spray or irrigate Natrasol Seaweed Extract at the rate of 3-5L/Ha every 2-4 weeks during the growing season as a general plant tonic to improve plant health, flowering and fruit production.

Use mixed sprays within 4 hours of mixing and do not store any unused mixture.

APPLICATION RATES AND TIMING

STAGE	RATES
Runners	Soak runners 1:400 for up to 8 hours prior to planting
After planting	Natrasol at 3L/Ha Folia spray or irrigation
Ever 2-3 weeks	Natrasol at 3L/Ha diluted in a minimum 200L water
Prior to the start of harvest	Natrasol at 3L/Ha diluted in a minimum 200L water
